

Photoshop: USING LAYERS

- In this exercise, we will combine at least **2** images to create a surreal or abstract double-exposure effect.
- We will learn to use **layers, layer mode, and opacity**

Step 1

- Download two photographs that you would like to combine. Add it to your Photoshop folder.
- Open both in Photoshop.

Step 2

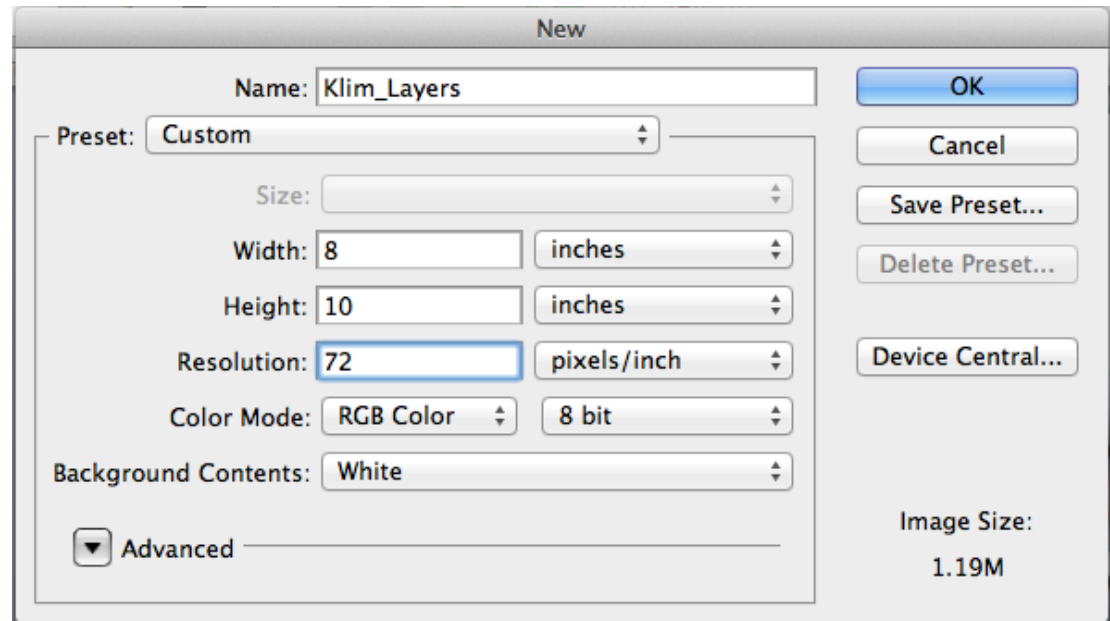

- Create a new file

- It should look like this.

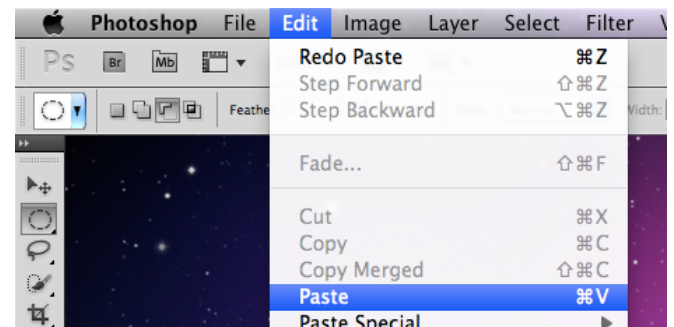

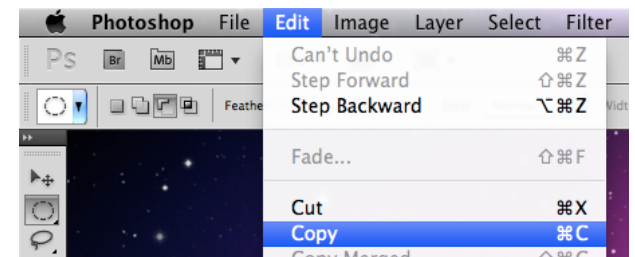

Label File

“Name_Layers”

Step 3

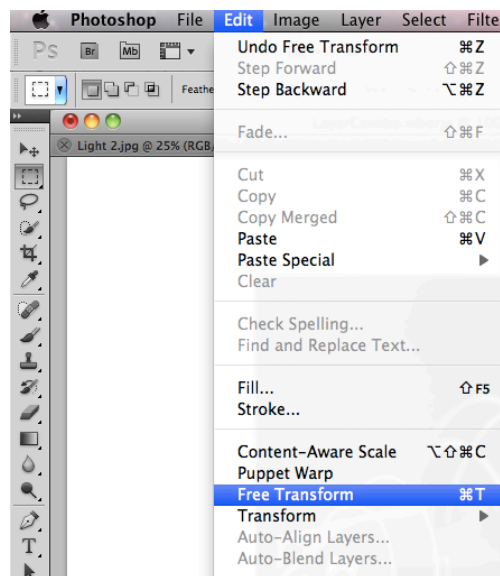

- Using the rectangular Marquee Tool, select your entire image.
- Copy and paste into your new Layers file

Step 4

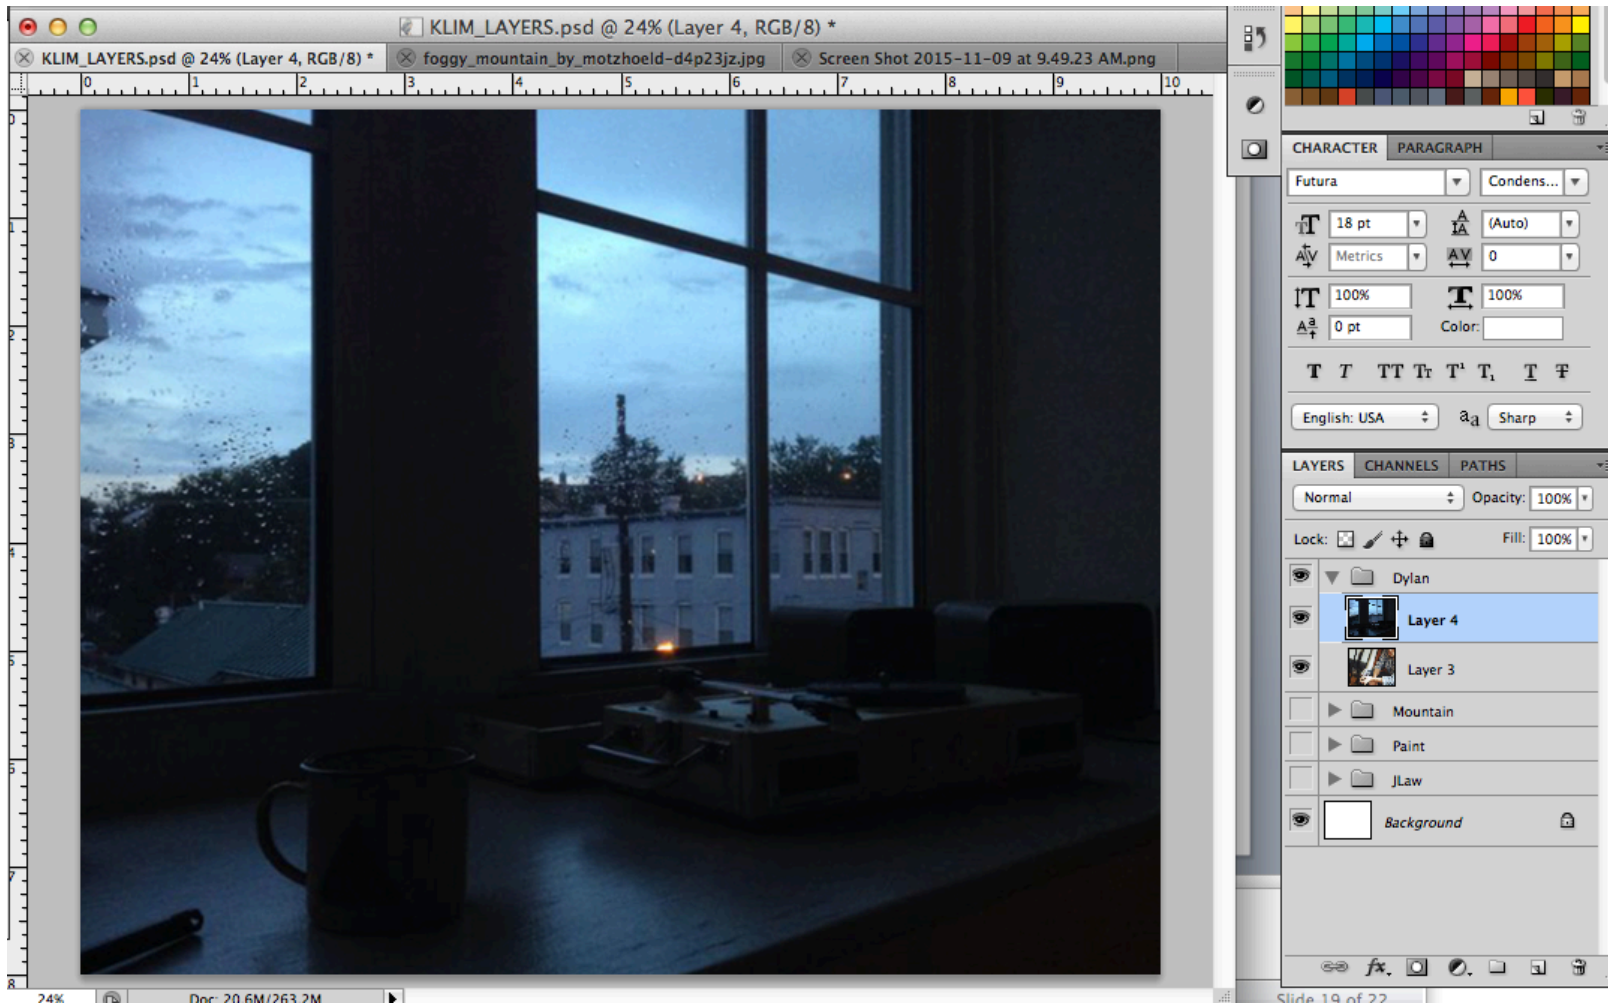

- Your copied image may be too big or small for the Layers file.
- To make it fit the background, we will use the **Free Transform Tool**.
- Click and drag on the corners of the image **while holding shift**! (Not holding shift will warp your image)

* Once the image size is to your liking, you must press the **Enter/Return** key to exit the **Free Transform** mode

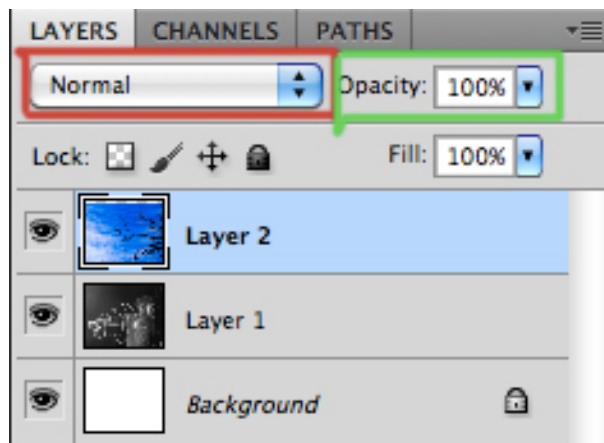

Step 5

- Repeat steps 3 & 4 on your other image.
- After this step, in your Layers file, you will have 2 layers.

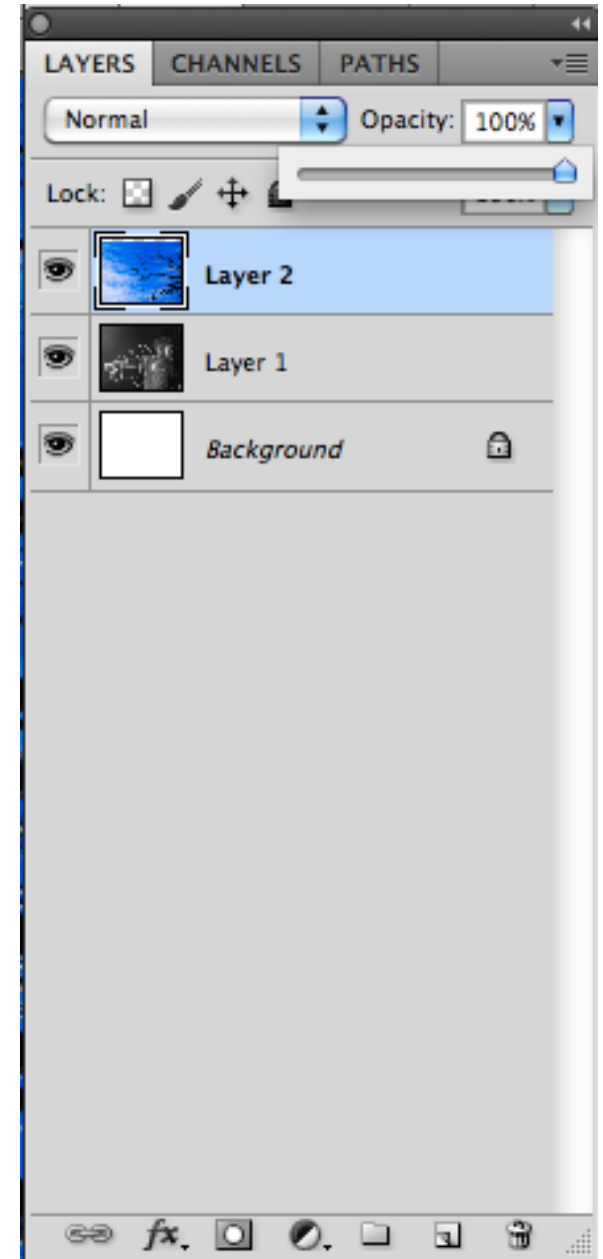

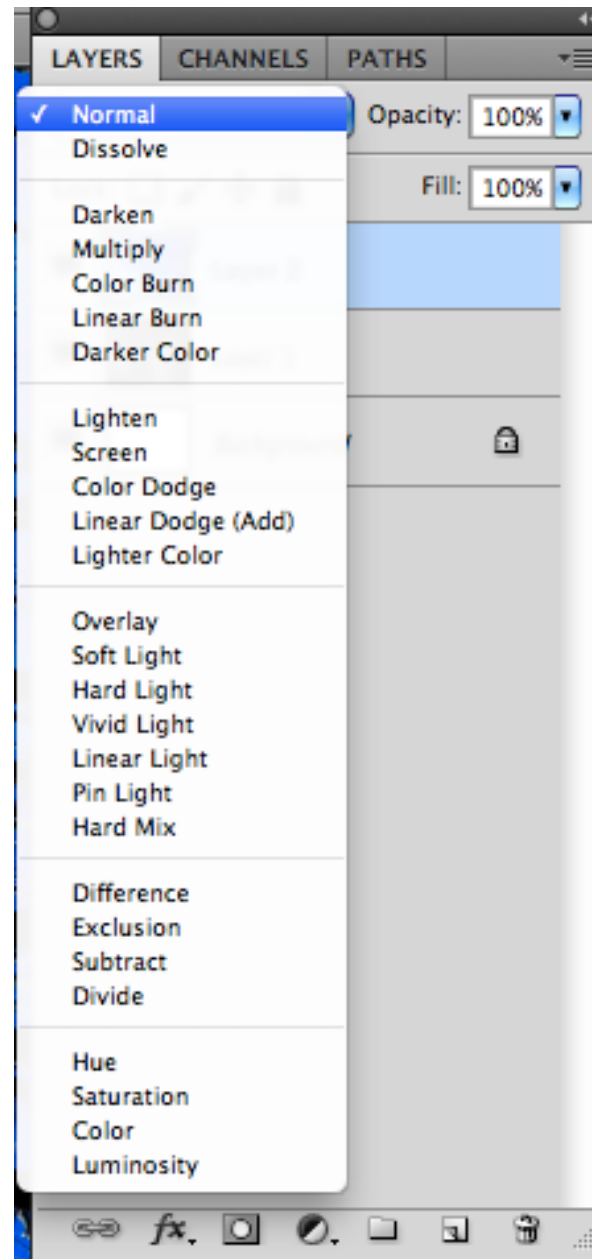

Layer Mode & Layer Opacity

-The red box is in the layer mode.

-Selecting different modes will have different effects on your layer.

-The green box is the opacity.
-Moving the bar from 100% will change how much you can see through that layer to the one below it

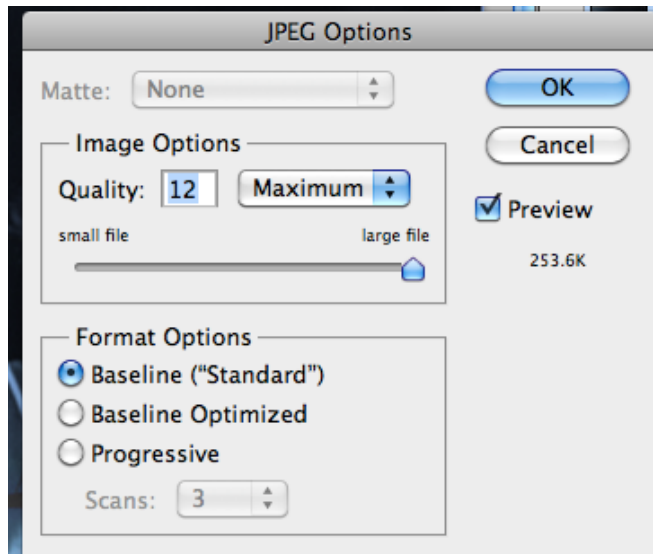

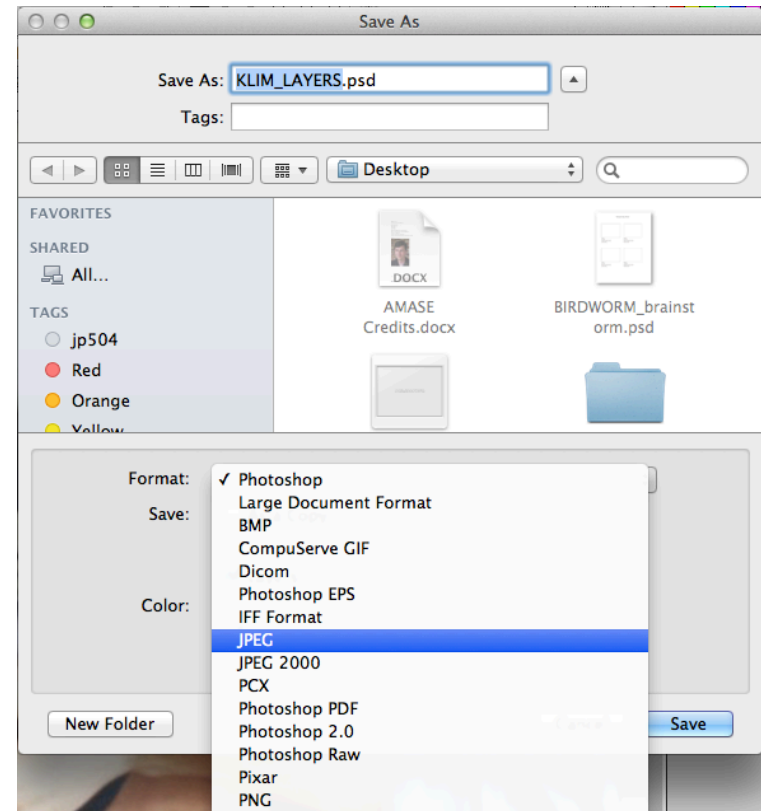

Step 6

Adjust and experiment with **Layer Mode** and **Opacity** to create your double exposure effect. For mine, I decided the "Screen" Mode and "40%" Opacity looked best.

Step 7

Saving as a jpeg

1. File > Save
2. Click Format and select JPEG
3. Click OK for JPEG Options

Upload JPEG To Flickr

For a more *surreal* approach...

Step 1

- Download two photographs that you would like to combine. Add it to your Photoshop folder. Repeat Steps 3-5.

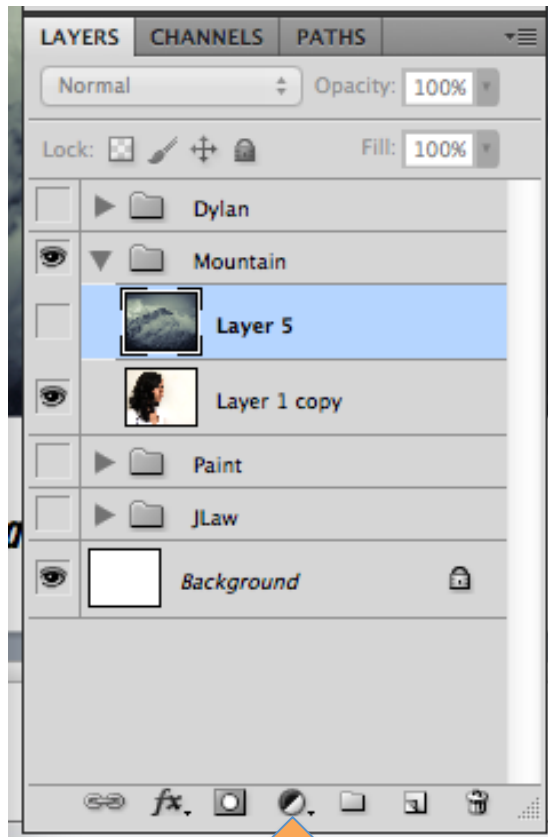

** Portraits + landscapes or abstract imagery usually make for interesting combinations!*

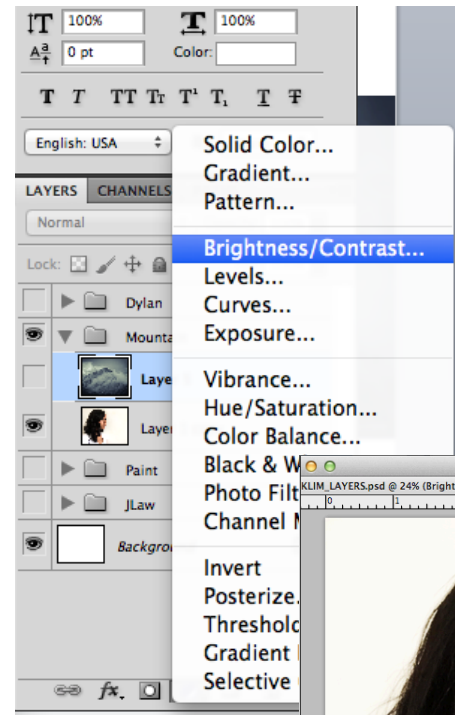

Step 2

- Adjust Brightness/Contrast of background image.

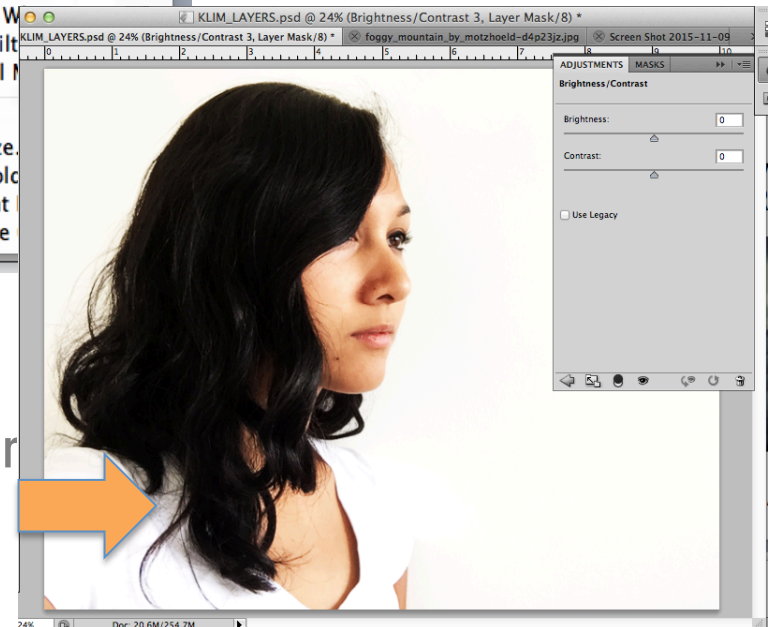

* *This technique works best with a high-contrast image where the background is as light as possible!*

1. Click this button

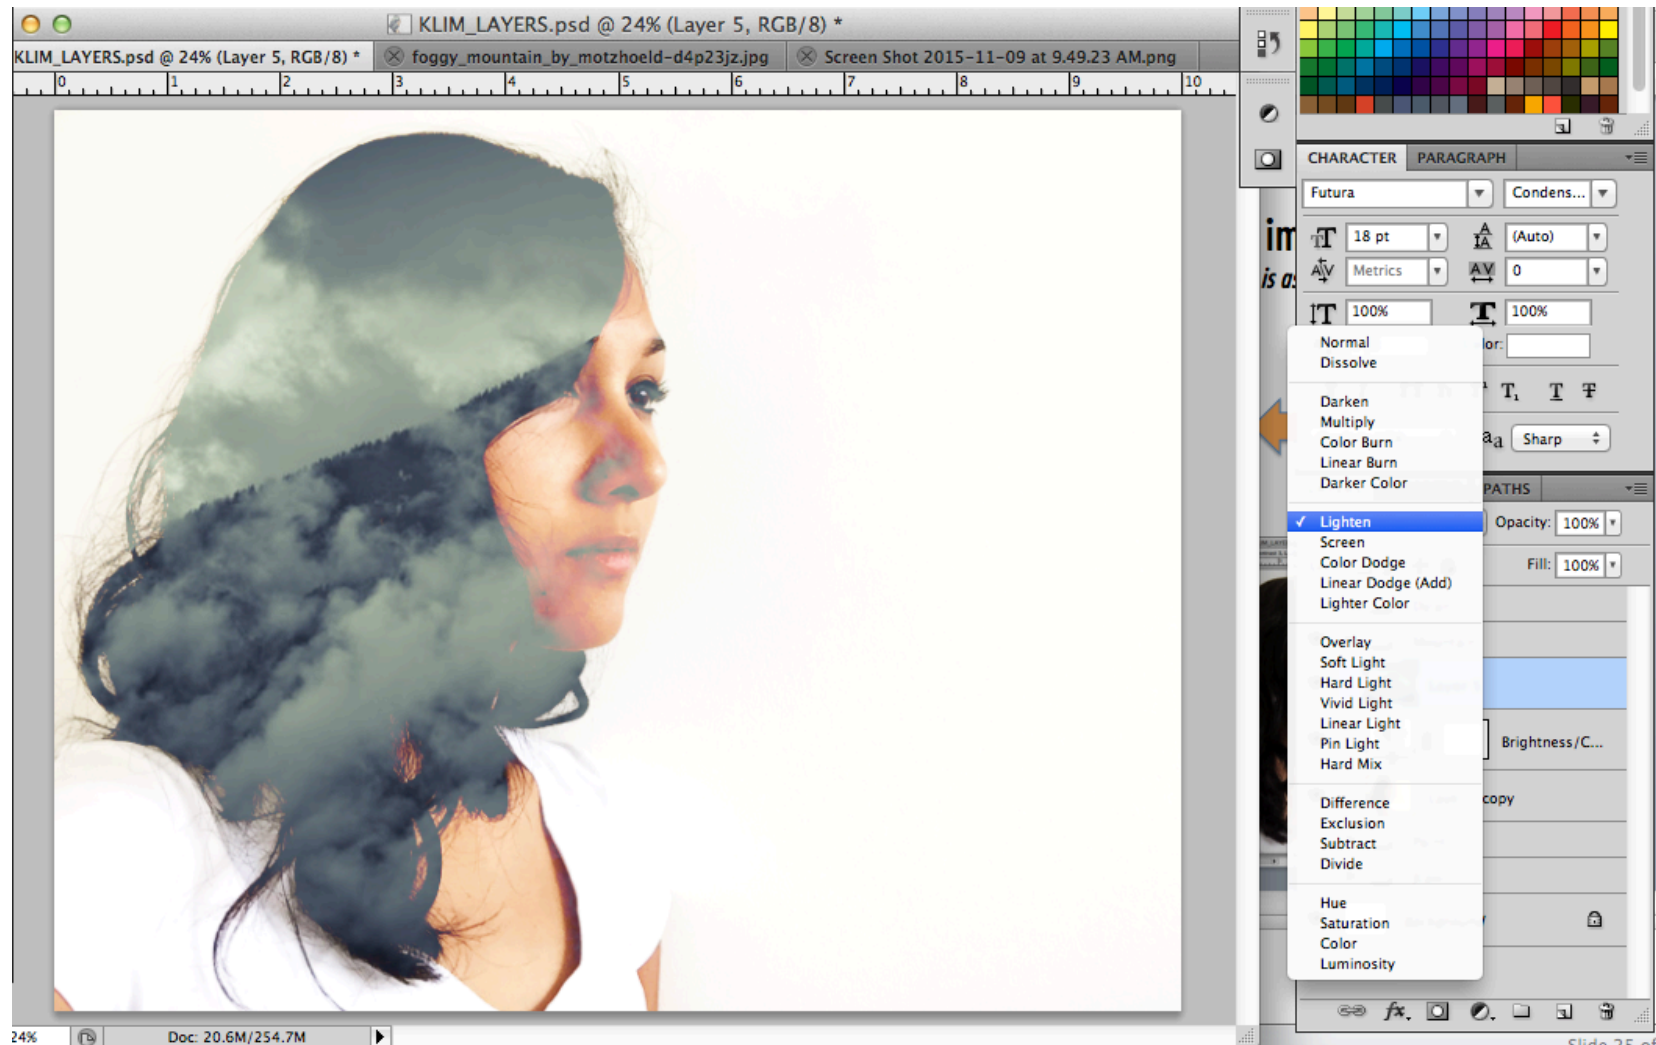

2. Select "Brightness/Contrast"

3. Adjust so that your background is as light as possible.

Step 3

Adjust Layer Mode of second image. If you select "Lighten," the image should only appear over the dark areas of your background image.

Step 4

You may want to use the eraser at a low opacity to let some more of your background image show through.
